## VERTICAL COLUMNS FORMWORK SYSTEM

PILCO®

# Round Columns Formwork

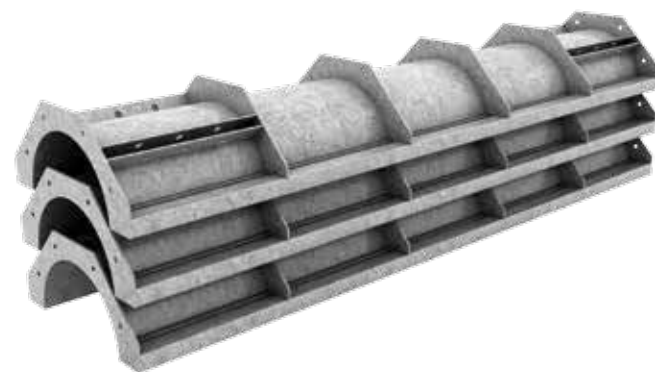

The implementation of circular formworking from standard galvanised steel components is straightforward with Pilco® columns formworking.

Metalusa project engineers developed the system in such a way as to allow the incorporation of other metallic elements by means of simple, rapid connections to carry out complex engineering works.

Hence, circular formwork assembly using non-circular, highly complex geometries is carried out with simplicity and economically.

The Pilco® circular formworking system is ready to withstand high concrete pressure loads.

## SIMPLE AND SAFE

Pilco® Round pillars allow high productivity to be achieved at the works' site as they are endowed with a crane lifting system as well as an easy-to-use closing system.

By deploying the round Columns formworking system the work is carried out in total safety.

## RESISTANT

Pilco® round columns are made of highly resistant galvanised steel, lending them greater durability and performance at the works' site.

## VERSATILE

Metalusa Round Columns are highly versatile owing to their compatibility with the Forteko® vertical formwork system.

In this way it is possible, using Metalusa round columns formworking, to implement pillars or finishes on semi-circular walls.
